

Concept of Operations: Introduction

Jon-Paul Herron
GEC7

Concept of Operations Doc

- Available on OMIS wiki
- overall architecture for operations of GENI as a whole
- Comparison of models
 - central
 - completely distributed
 - “meta” operations
-

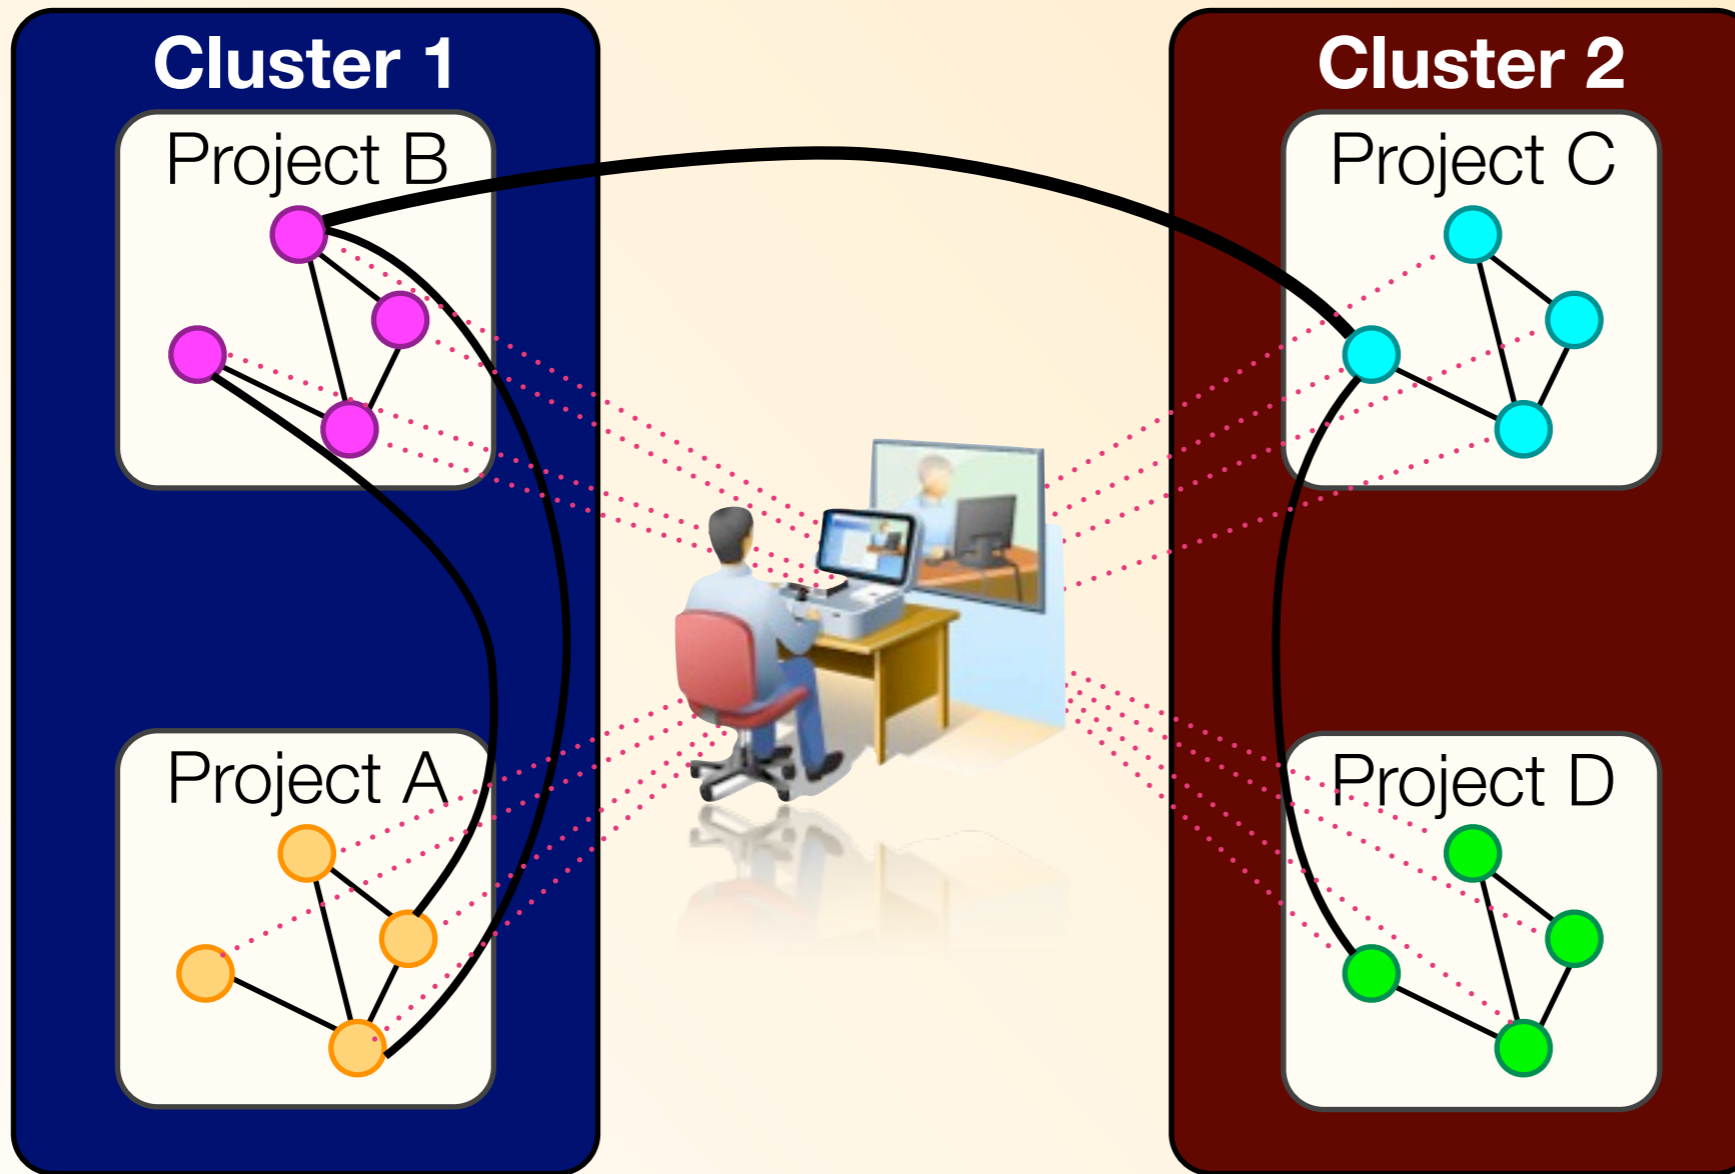

Concept of Operations Doc

- Important Task Areas for GENI Ops
 - data sharing: collecting data that would be useful for research from pieces of GENI infrastructure
 - facilitation of event notifications among aggregates
 - coordination of users and aggregates (when needed)
- What possible models are there?

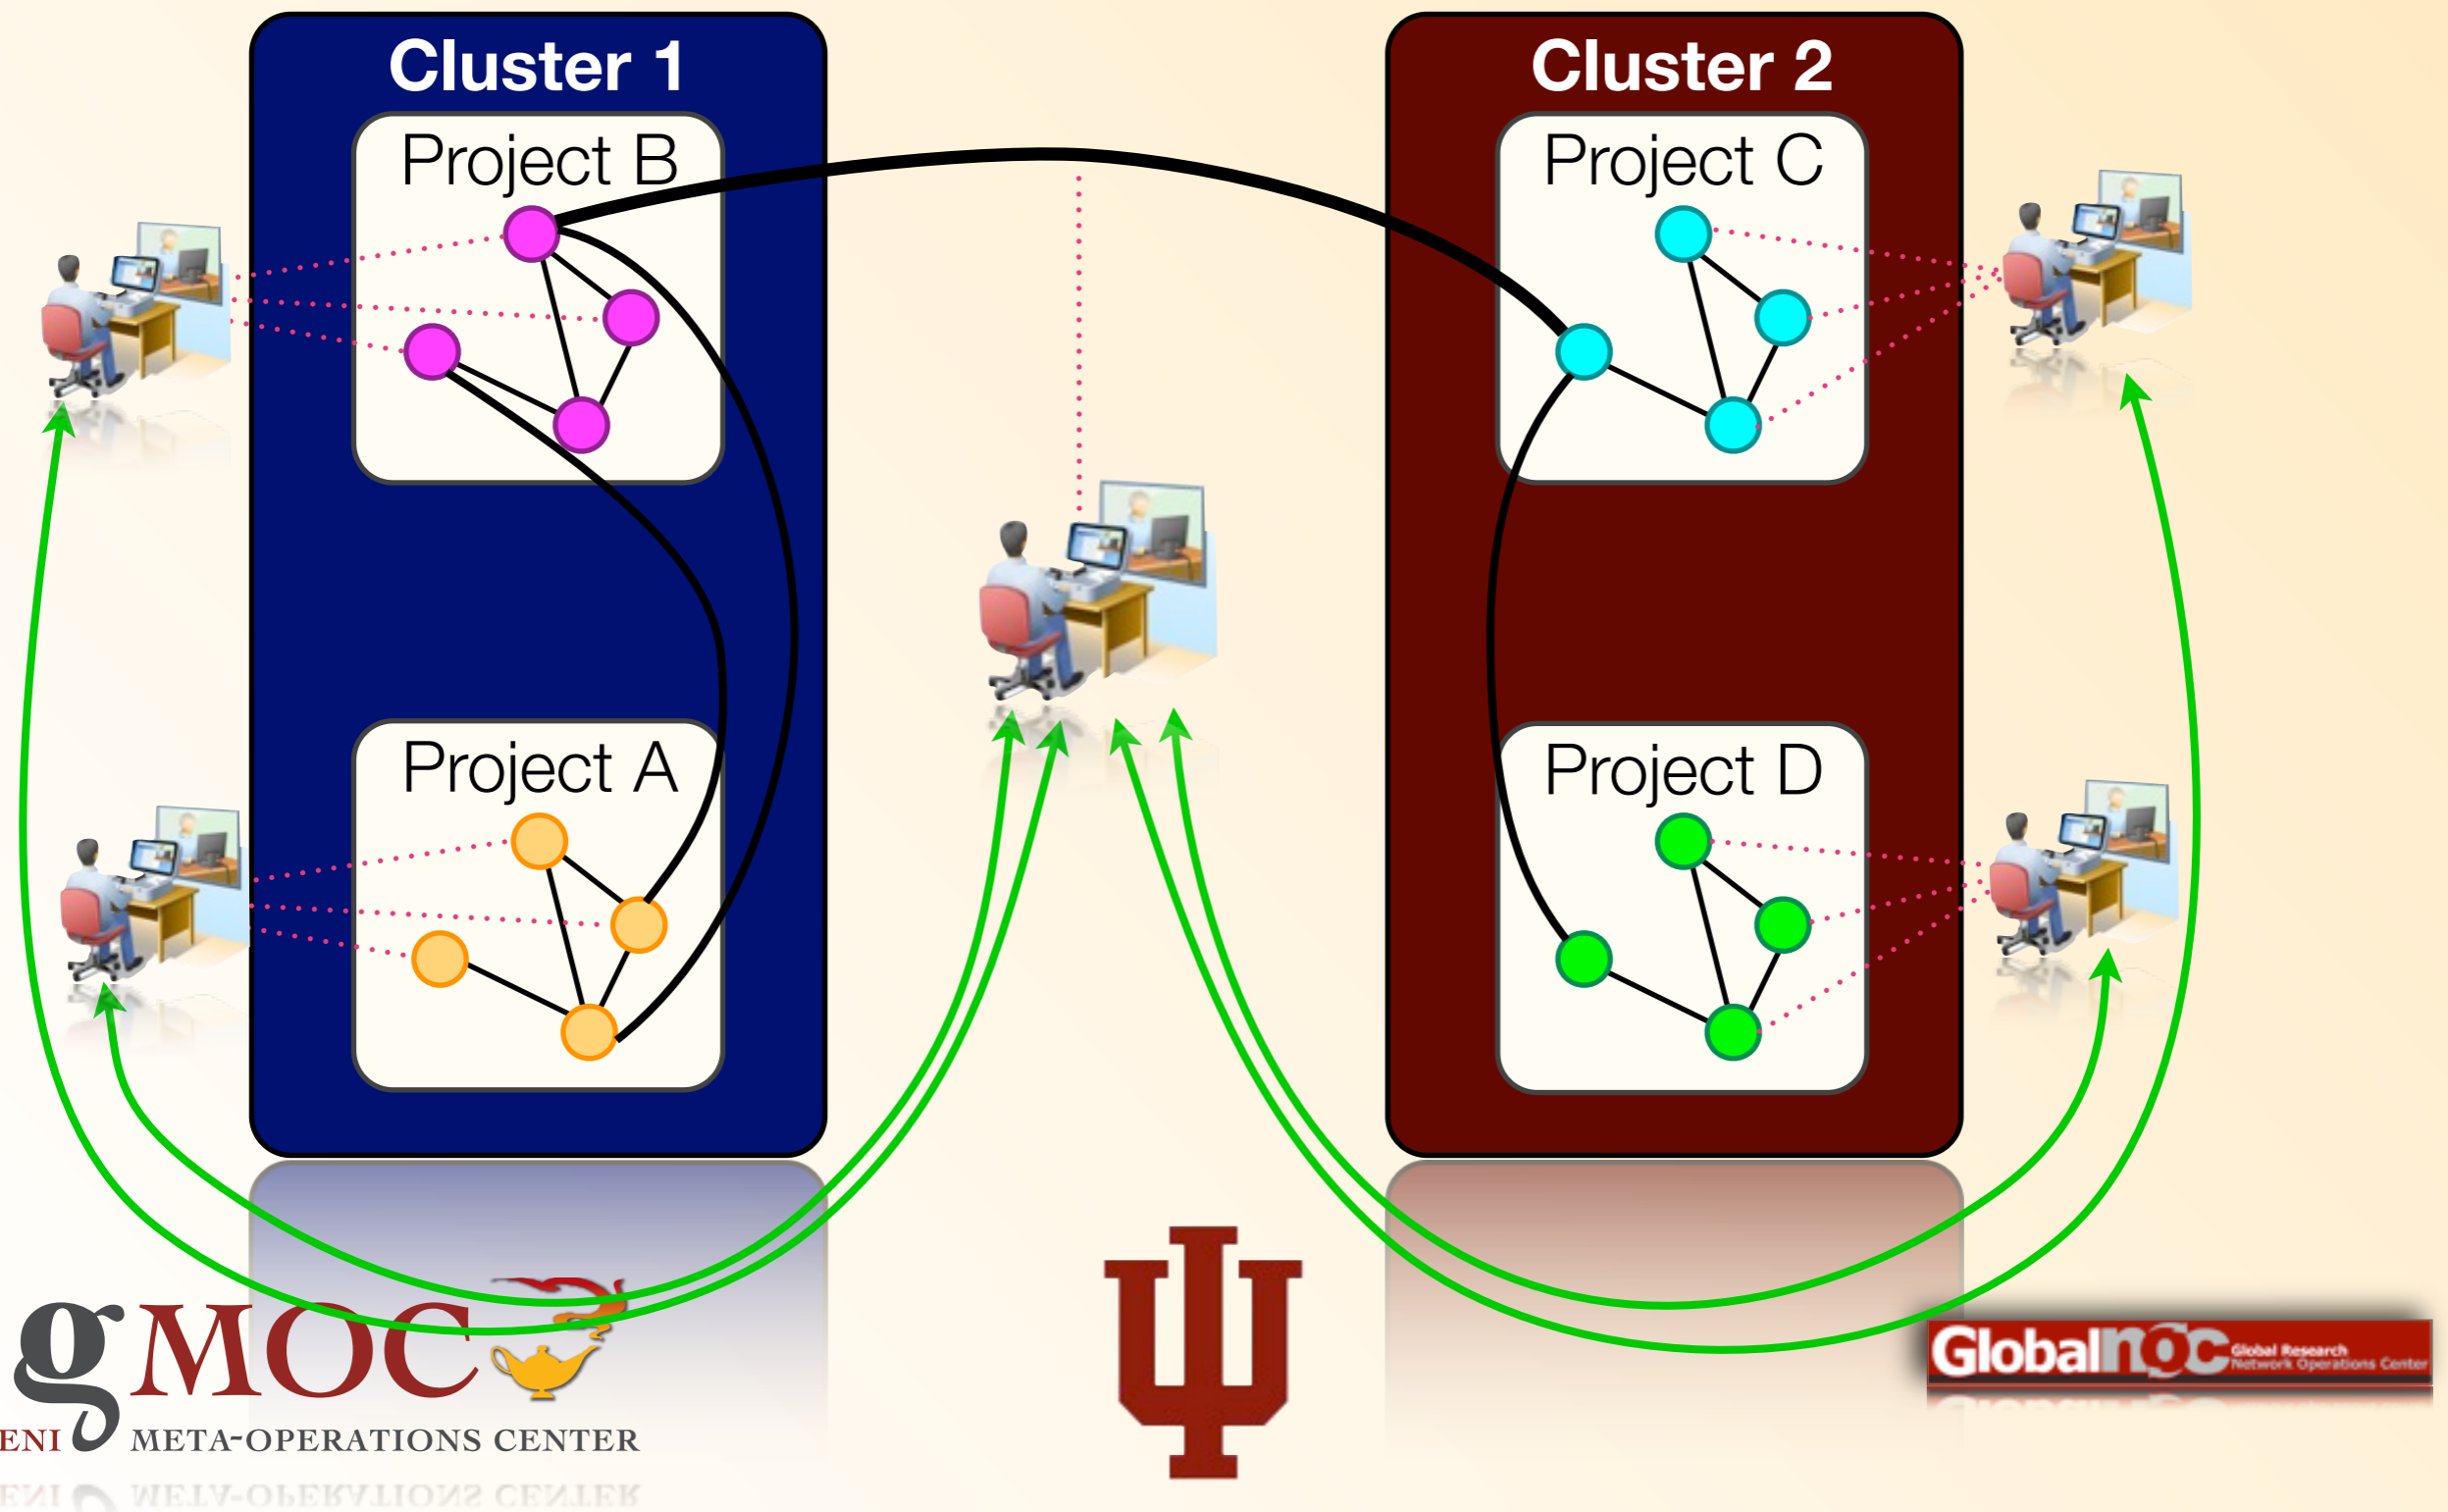

Option 1 - Completely Distributed

Option 2 - Centralized

Option 3 - Meta-Operations

Meta-operational tasks

- Specific Tasks for this organization would include:
 - Serve as the operational “front-door” for GENI operational requests
 - Direct problem reports to the appropriate GENI project operational contacts
 - Track GENI-wide issues
 - Provide a unified place to get operational data
 - Gather GENI-wide statistics and reporting on availability, usage, etc for GPO & other interested GENI stakeholders
 - Facilitate communication between multiple parties for complex problems that span multiple projects
 - Perform some GENI-wide operational duties such as emergency stop

Tasks to get ready

- Agreement on:
 - classification on incidents/request types
 - policies on what operations aggregates will support and the timeframes for action when faced with different incidents/requests by category
 - mechanisms for authentication and authorization
 - determination of what data is public and private
