

Experiment Support in TIED Today and Tomorrow

Ted Faber, John Wroclawski,
Steve Schwab, and Brett Wilson

Talk Outline

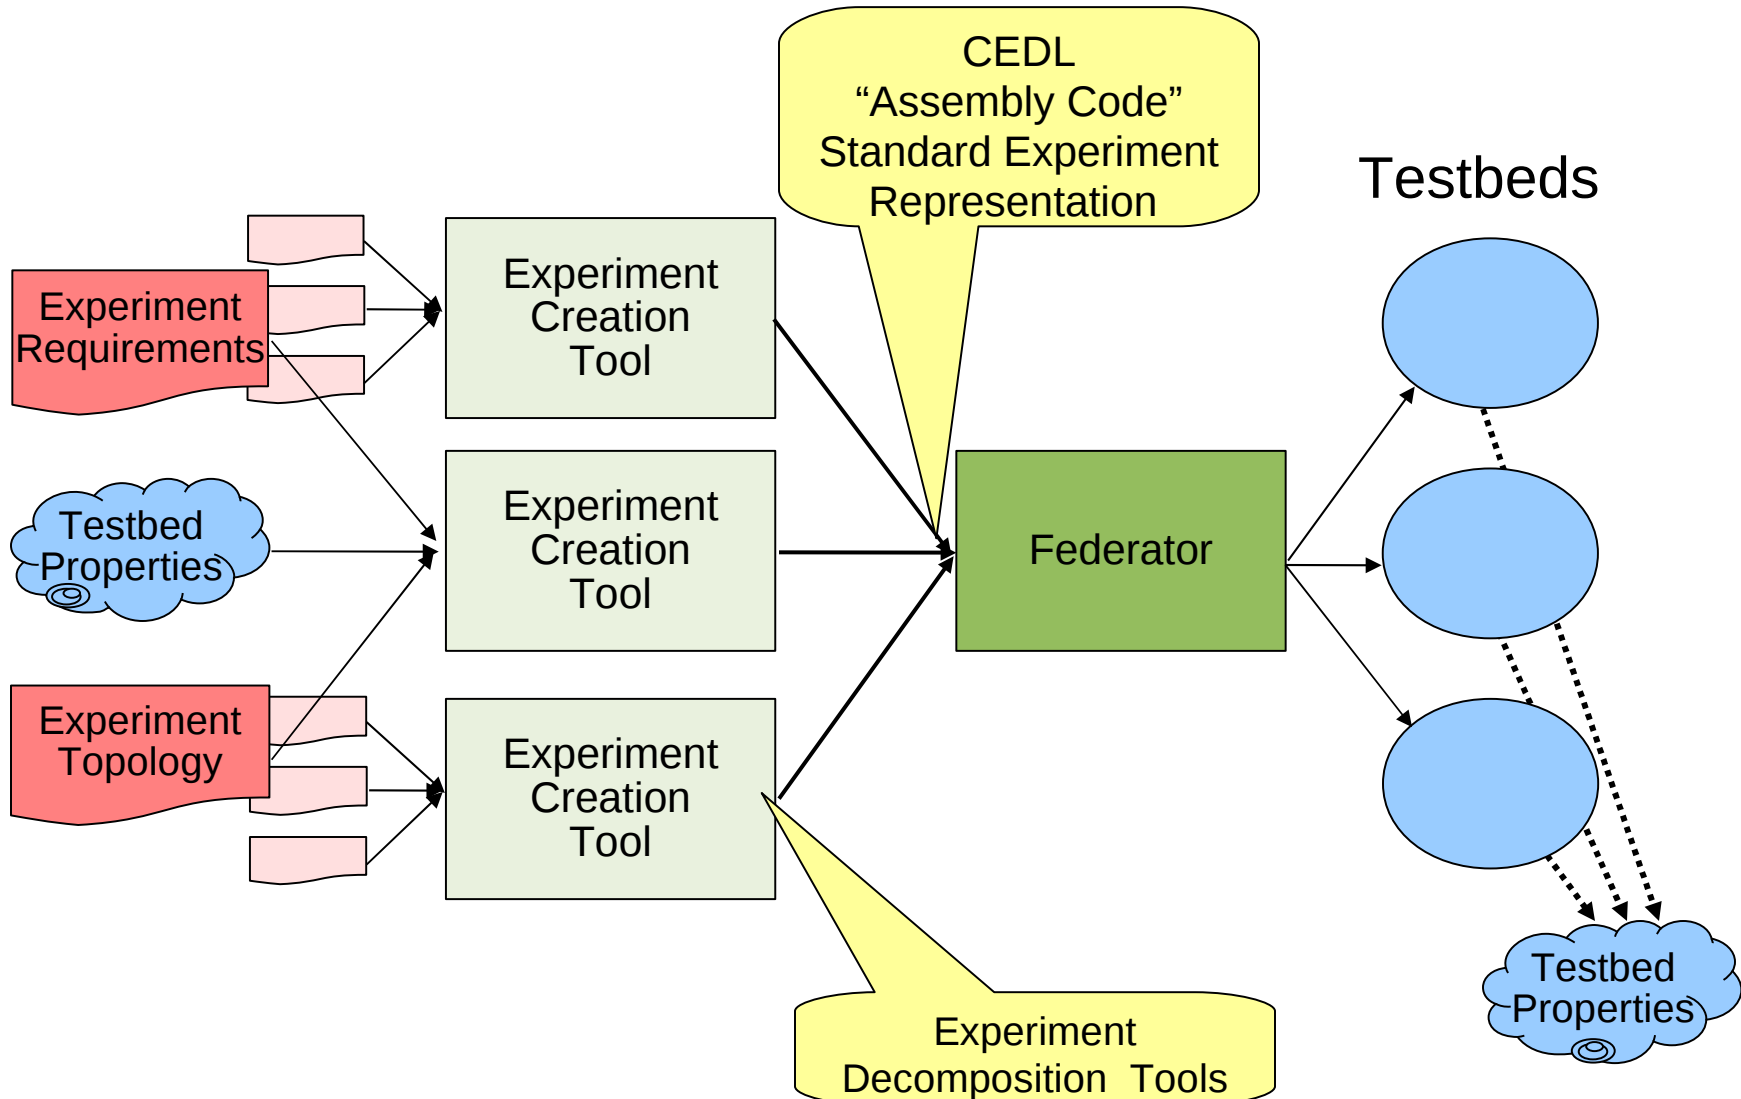

- Experiment Description Today: CEDL
- Experiment Automation Tools: SEER
- Experiment Description and Validation Tomorrow
 - Validating invariants and environment
 - Understanding and constraining risky behavior

TIED is Dynamic Federation

- *On-demand* creation of experiments spanning *multiple, independently controlled* facilities
- Why?
 - Scale
 - Unusual facilities
 - Data & knowledge sharing
 - Information hiding - multiparty scenarios

TIED Federation Architecture

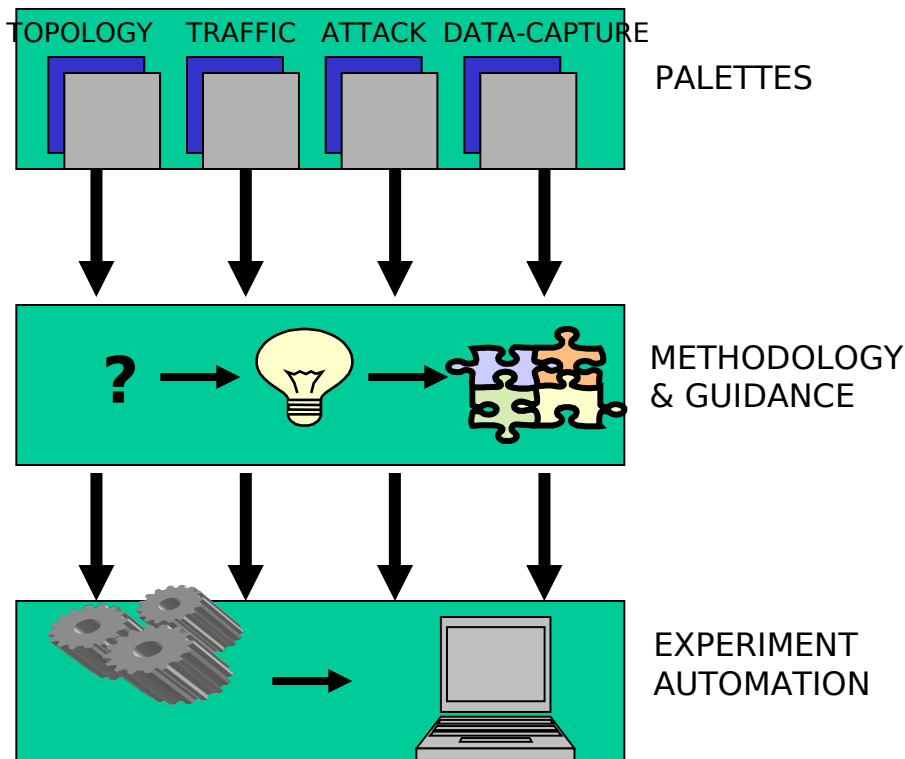

Slice Topology: CEDL

Canonical Experiment Description Language

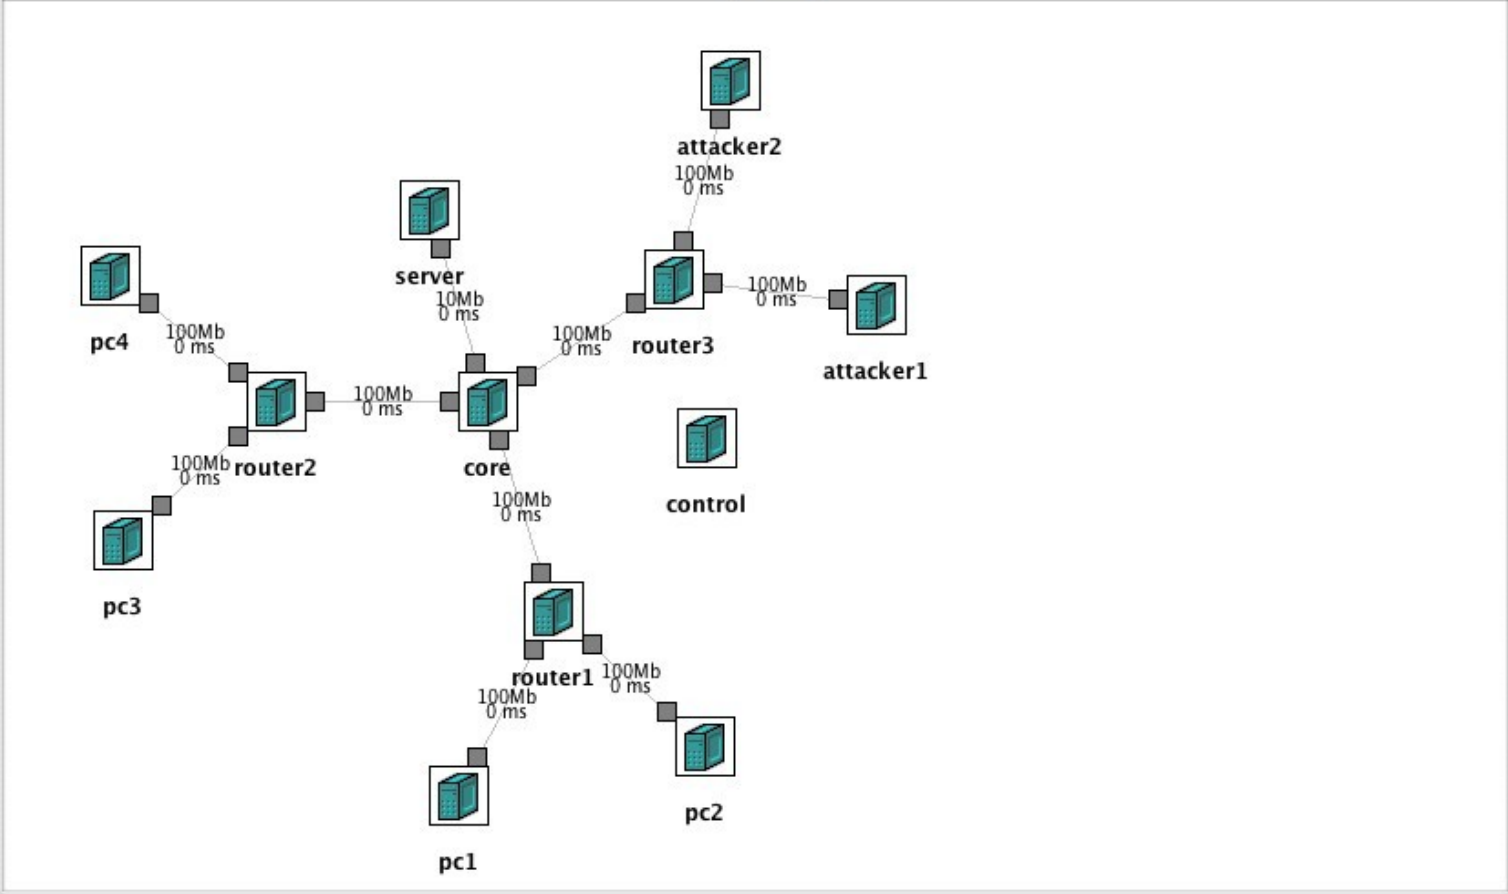

- Standard low-level experiment representation – “assembly code”
- Output of all tools / input to Federator
- Expressiveness (today):
 - Core semantics:
 - Logical {nodes, links, elements}
 - Topology (Emulab/ns2)
 - Annotations: logical attributes (eg, node type)
 - Type information: router, switch, etc.
 - Physical selection: map to specific instance
 - Annotations: physical attributes
 - “Escapes” to allow physical configuration of hardware

Experiment Methodology and The SEER Facility

- *Palettes* capture high-level “design patterns” for well-formed experiments: Topology, Background and Attack Traffic, and Packet Capture and Instrumentation. Skeleton palettes for original and customized experiments are also available.
- *Methodology Engine* frames standard, systematic questions that guide an experimenter in selecting and combining the right elements.
- *Experiment Automation* increases repeatability and efficiency by integrating the process to the TIED environment.

Conclusions

- Federation-based Slices Described in CEDL
 - Uniform slice description language
- Experiment Management in SEER
 - Extensible agent system
 - No architectural dependence on TIED
 - Implementation uses TIED facilities
- Ongoing work in TIED
